CAMPUSCONNECT

Your campus, connected.

One academic workspace

Courses, class discussions, feedback, project applications and the campus community.

Rupam

Gmail access. Verified ChatGPT sign-in. Persistent hosted data.

THE PROBLEM

A clearer path through campus work.

Scattered communication

Questions, course rosters and project opportunities often live in separate channels.

Feedback without a clear view

Professors need structured ratings and trends they can act on.

One place to participate

CampusConnect joins these workflows in a consistent student and professor workspace.

IDENTITY AND ACCESS

Three roles. Clear permissions.

Students

Join with a verified Gmail identity, choose a username and access enrolled courses.

Professors

Register after administrator approval, then manage courses, projects and feedback.

Administrator: Rupam

Approve professor emails. Administrator access is tied to drupam1289@gmail.com.

COURSES AND ENROLLMENT

Create a course. Build the schedule.

1. Define the course

Choose a name, date range and weekdays. Lecture sessions are generated automatically.

2. Enroll the class

Add registered students by email or upload an Excel file with an Email column.

3. Share teaching access

Add registered co-instructors. Server-side membership checks protect each course.

DISCUSSIONS AND FEEDBACK

Ask questions. Measure understanding.

Session discussions

Post messages and replies. Unread counts track activity; updates refresh every three seconds.

Structured student feedback

Rate content, delivery, clarity, engagement and pace from 1 to 5 once per session.

Professor analytics

Review average ratings, written feedback and changes across sessions.

PROJECTS AND FORUM

Find opportunities and build community.

Academic projects

Professors publish requirements for branch, batch and CPI.

Application review

Students apply with a resume link. The project owner accepts or rejects each application.

Campus forum

Create categorized posts, reply to discussions and vote using a student username.

HOSTED ARCHITECTURE

Frontend, backend and data - together.

React + Vite

Responsive interface with same-origin API requests.

ChatGPT Sites Worker

Verified platform identity, API routing, role checks and shared application controllers.

Persistent D1 database

Server-side records, versioned schema migrations and unique database indexes.

VERIFICATION AND DELIVERY

Built, checked and ready to demonstrate.

Verification

Production build and frontend lint pass. All 10 integration test results pass.

Browser and production checks

Browser QA covers registration, course creation and discussions. Live admin requests return 200; /api/health reports a connected database.
