This document describes the updated ChatGPT-hosted implementation. It supersedes the earlier MongoDB/SMTP deployment instructions in the supplied project documents.

1. Purpose and users

CampusConnect gives students and professors one workspace for courses, class discussions, feedback, academic projects and campus-wide conversations.

Student

A Gmail user can create a profile, access enrolled courses, ask questions using a username, submit feedback, browse projects and track applications.

Professor

An authorized professor can create courses, schedule sessions, enroll students, manage projects and review teaching feedback.

Administrator

Rupam authorizes professor email addresses. The hosted administrator identity is drupam1289@gmail.com.

2. Functional requirements

Identity and access

Use ChatGPT sign-in to establish a verified user identity. New registrations require Gmail addresses. The server validates the visitor and role on every protected request. Professor registration requires an administrator whitelist entry; the administrator can create a professor profile directly.

Course management

Professors provide a name, valid start/end dates and weekdays. The application creates scheduled sessions. Only the owning professor may delete a course. Authorized co-instructors may manage rosters and view analytics.

Enrollment

Professors add registered students manually by email or upload an Excel sheet containing an Email column. Repeated rows are handled without duplicate enrollment. Files are limited to 5 MB.

Discussion and feedback

Enrolled students and course instructors can view and post session messages and replies. Discussion updates are polled every three seconds. Students submit five ratings from 1 to 5 and optional written feedback once per session.

Projects and community

Professors publish projects with branch, batch and CPI criteria, then accept or reject applications. Students supply a resume URL and eligibility details. The forum supports categorized posts, comments and votes.

3. Quality and data requirements

Persistent records are stored server-side in the Sites D1 database. The production build does not recreate or seed user data. Unique indexes protect email, identity, username, application and feedback constraints.

Protected requests require verified platform identity. Browser local storage controls UI continuity only and is not an authorization source. Course access and application decisions are checked on the backend.

User-visible errors should leave the interface usable. The UI adapts to mobile and desktop sizes. Production secrets are stored in Sites environment settings and excluded from Git.

No previous MongoDB connection or backup was supplied. The owner requested a new hosted database. This version therefore does not claim to contain or migrate records from the previous deployment.
