Updated: 11 November 2026

## Hosted application

https://campusconnect-rupam-2026.lucentterrapin1.chatgpt.site

## Source repository

https://github.com/rupam1123/CampusConnect

This document describes the updated ChatGPT-hosted implementation. It supersedes the earlier MongoDB/SMTP deployment instructions in the supplied project documents.

# 1. Verification scope

The application is validated through the production frontend build, frontend ESLint checks and the bundled Worker integration tests. Browser QA covers registration, navigation, course creation, generated sessions and message submission.

The automated suite runs against a new isolated in-memory database. It does not write to the hosted database or any old MongoDB service. Production deployment readiness is checked separately through the platform deployment result and /api/health.

# 2. Automated scenarios

## Authentication and roles

Anonymous requests to protected APIs are rejected. Gmail profiles can register. Non-Gmail registration is rejected. Faculty registration requires approval. Non-administrators cannot access professor administration.

## Courses and enrollment

A professor creates a valid course and generated lecture session. Manual enrollment normalizes email. Excel enrollment adds valid registered students, handles duplicate rows and reports skipped emails. Non-members cannot read course sessions.

## Discussions and feedback

Messages and replies persist and return populated authors. Mark-read updates unread counts. Invalid feedback ratings are rejected. Feedback is tied to the actual session course. Students cannot read instructor analytics.

## Projects and forum

A professor creates a project. Eligible students apply. Another professor cannot review the application. The owner can accept it. Forum posts, comments and votes return the expected counts.

## Data and deletion

Profile changes retain a usable account ID. Incorrect deletion confirmation is rejected. An owner with active courses or projects cannot delete their profile. Course deletion cleans up its sessions, comments, feedback and read records while retaining user accounts.

# 3. Evidence and limits

At the time of document generation, all 10 Node test runner results passed, including the parent flow and its nine scenarios. The frontend lint command completed successfully with no errors or warnings.

Browser QA successfully created a professor profile, created a course, displayed its generated sessions and saved a discussion message. The checked browser console showed no errors or warnings for that flow.

This is functional regression coverage for a submission-sized application. It is not a load test, penetration test or guarantee that no other defects exist. Hosted sign-in availability depends on the visitor ChatGPT account and the Sites platform.

Freshly hosted data starts empty; the administrator should create a course and approve any professor accounts needed for the demonstration.
